Web Vulnerability Assessment

SAMPLE REPORT · CASE-003

Prepared by: **Dickens Miheso** — Security Researcher
Date: 09 October 2026
Tools used: Nmap, Nikto, Gobuster, SQLMap
Classification: Sample / Educational — identifying details redacted

1. Executive Summary

This sample report illustrates the structure and depth of the write-ups produced after a web application security assessment. A representative target was assessed for common web vulnerabilities using a mix of automated scanning and manual verification. Three findings are summarized below, ranging from Critical to Informational, along with the risk each poses and the remediation recommended to the client.

2. Scope & Methodology

Testing covered external reconnaissance, port and service enumeration, directory and endpoint discovery, and manual testing of input handling across forms and parameters. **Nmap** was used for host and service discovery, **Nikto** and **Gobuster** for surface and content enumeration, and **SQLMap** to verify database-layer injection points flagged during manual testing. All testing was performed in a controlled, authorized lab environment.

3. Findings Summary

Severity	Finding	Impact & Recommendation
CRITICAL	Reflected Cross-Site Scripting (XSS) in a user-input field	Unsanitized input allowed script injection, creating a session hijacking risk. **Fix:** output-encode all user input and apply a Content-Security-Policy. **Status: Remediated.**
HIGH	SQL Injection in a search parameter	Database extraction was achieved in the lab environment via a vulnerable query. **Fix:** use parameterized queries / prepared statements and least-privilege DB accounts.
INFO	General attack surface (ports, directories, banners)	Enumeration with Nmap, Nikto, Gobuster and SQLMap mapped exposed services and hidden endpoints. **Fix:** close unused ports, remove verbose banners, and restrict access to administrative paths.

4. Conclusion

All identified issues were disclosed with reproduction steps and remediation guidance. The Critical finding was retested and confirmed fixed; the High finding was handed off with a concrete remediation path. This sample reflects the format used across assessments: clear severity, business impact in plain language, and an actionable fix.

This is a sample report for portfolio purposes. Real client findings are redacted and shared under NDA on request. — dickensmiheso894@gmail.com
